our vision of the world

LAR Plásticos is a company with real values, with a young and innovative spirit, passionate about making a difference in society and the environment. Our commitment is to promote development and income generation through the best practices of the circular economy.

We want to leave a legacy for the next generations, with the certainty that it is possible to build a sustainable culture, where consumption and preservation of the environment go hand in hand.

hand in hand, towards a more prosperous future.

platform sustainable transformation

Founded in 2011, LAR Plásticos is a 100% Brazilian company, leader in the treatment and transformation of plastic waste in the country.

Located in the municipality of Atibaia (São Paulo, Brazil), it has more than 400 direct employees and a 26,000 m² factory, where around 40 tons of raw material are processed daily.

In addition to the technology incorporated into production processes and the quality of its products, LAR Plásticos is also recognized for its

contributing broadly and effectively to the development of a more sustainable economy.

Technology and innovation at the service of

In our facilities we once again transform postconsumer and post-industrial plastic waste into raw material. In other words, this is where the magic happens!

We have a team specialized in product development, processes and quality, as well as a technical laboratory to carry out various tests, always complying with ABNT, ISO standards or the specifications required by

Our Engineering Department develops modern molds that meet the growing market demands in different product segments. Our factory has stateof-the-art machinery, small and large, used in the grinding, extrusion, injection and rotational molding processes.

This structure allows us to be at the forefront in the national market, delivering highly resistant and reliable products made from 100% recycled material.

9001:2015

Internal: 240 (width) x 353 (height) x 370 mm (length) Exterior: 300 (width) x 460 (height) x 440 mm (length) Material: HDPE or PP

We need to stop burying trash!

We urgently need to raise awareness about the importance of promoting a more sustainable flow of post-consumer materials, considering all kinds of waste as a useful and reusable resource.

The cycle does not end when citizens correctly dispose of their household waste.

In fact, at this point the problem is just beginning.

As society generates much more waste than it is possible to treat, the surplus continues to go to landfills, landfills, rivers and forests, contaminating soils and oceans.

We want to give visibility to the challenges of recycling in Brazil, being part of the solution and supporting the actors of this productive chain in the reinvention of the use and disposal of plastic.

focus on

selective collection

Selective collection is the method that optimizes waste disposal processes. And speaking of "garbage", it is worth noting that this is a generic word, used to designate the terms "waste" (discards that still have some possible use through recycling or reuse) and "reject" (those that no longer can be discarded). reused).

It all starts with individual awareness of the importance of selective solid waste collection.

The capture of the "raw material", carried out by different agents, encourages the generation of jobs with various cooperatives throughout Brazil.

As benefits of selective collection and correct disposal of waste, we can highlight the reduction of pollution, savings in energy and water consumption, the reduction of expenses with urban cleaning and the generation of employment and income through the sale of recyclables.
